1 Research Interests

Primary research interests are related to modeling, simulation and analysis of static and dynamic, elastic and inelastic, deterministic and probabilistic behavior of engineering solids and structures. Focus is on rational computational mechanics formulation, efficient implementation, verification, validation and development of practical applications. Particular interest is in development and use of methods that reduce epistemic, modeling uncertainty. Further, propagation of aleatory uncertainties, that is, time domain modeling and simulation of behavior of inelastic solids and structures with uncertain material and uncertain loading, is of interest as well. Current work is on development and use of high performance computational systems for realistic modeling and simulation of static and dynamic, elastic and inelastic, deterministic and probabilistic, behavior of earthquakes, soils, structures and their interaction. The Real-ESSI Simulator System (<http://real-essi.info>), is an example of such a system.

2 Teaching Interests

Teaching interests are closely related to my research activities, focusing on theoretical, computational and applied aspects of mechanics on both undergraduate and graduate levels. In particular, recent teaching is related to:

Theoretical and computational, deterministic and probabilistic elastic and inelastic mechanics

Application of models and numerical simulations to solving practical civil engineering problems
